# How Buying Just One Bitcoin Could Make You a Millionaire Fast!

## Old World Finance is Dead!

The banking and finance industry may not realise it yet, but with the advent of Bitcoin, their death-knell has already been sounded. During the next few years Bitcoin and its underlying Blockchain technology will disrupt the entire financial industry in ways we cannot yet fully understand or predict.

But what we do know, is that those who recognised the potential back in 2010 and invested in this nascent technology - when Bitcoin had its first market price of just 6 cents - have been handsomely rewarded for their foresight!

Just imagine if **you** had spent just \$100 buying Bitcoin back in August 2010, when it was only 6 cents a piece. By the time it hit \$6,000 you would have made 100,000 times your original investment, or \$10 million dollars! And even more at the [current price](#).

Turning \$100 into \$10,000,000 is mind-boggling for sure, especially in such a short time frame. But this is the very nature of disruptive technologies and the profit potential they represent. Now you may be thinking: *“Oh, how I wish I knew about Bitcoin back then. I could have been a multimillionaire by now!”*

Fortunately it's not too late to cash in on the ongoing financial revolution that is Bitcoin. So let me put my proposition to you plainly. If you were to purchase just **one** Bitcoin now, you could become a millionaire within the next few years. I can already hear you saying, *“It can't be possible for Bitcoin to rise that much in price! The whole idea is too risky and based on too optimistic a scenario.”* - but hear me out.

Yes there is risk. No one knows for sure what Bitcoin will be worth in the future, but there are plenty of use-cases and scenarios that make such a prediction possible. And when it comes to risk you always have to look at the potential reward and consider if the risk is worth taking.

In my view, risking the money to buy **one** Bitcoin would be well worth it, if a \$1 million outcome is highly likely. So the question is, under what conditions *could* Bitcoin be worth as much as \$1,000,000?

There's **one** condition I can state quite unequivocally, and that's the fact Bitcoin would need to reach a total market cap of around **\$16.5 trillion** in order for a single Bitcoin to be worth \$1 million - based on Bitcoin's maximum supply and estimated number of “lost” coins. Keep in mind that “market cap” is the total value of all bitcoins in circulation. So based on a realistic supply of 16.5 million bitcoins - 16.5 million times a \$1 million price would equal a market cap of \$16.5 trillion.

## How Bitcoin Could Reach a \$1 Trillion Market Cap

Predicting future prices must take into account the fact Bitcoin has a maximum supply of 21 million coins (minus lost ones), with each one divisible by 8 decimal places. This is the reason Bitcoin is often referred to as “Gold 2”, meaning its scarcity drives up the price when demand rises. And why would demand rise? There are many reasons, including the following:

**Currency Debasement:** To fully grasp the scale of this you only need to remember what things used to cost when you were young. It’s not that prices have risen since then, rather that money has become worth less. And when money loses value rapidly things can get out of hand, like in Venezuela where the population is being impoverished by hyperinflation.

**Economic Crisis:** There is plenty of evidence we are in for another economic shock in the not-too-distant future, which many commentators believe will make the 2008 financial crash look like a picnic. Whenever there has been a major crash in the past, people have always turned to gold as a safe haven. Bitcoin has already established a similar safe haven status.

**Political Instability:** The world we live in is increasingly fragile as the old order is being challenged and overturned at an increasing pace. Witness the turmoil caused by the UK’s Brexit vote or the emergence of President Trump in the USA. Such political shocks cause nervousness and concern in global markets and once again drives money to safe havens.

**World War:** Nothing causes panic and mayhem in financial markets more than war. The danger we face today is the real possibility of a war breaking out between major nuclear armed nations. Such an event would have a massive impact on every single person on this planet and have a catastrophic effect on global markets. Bitcoin could surely rise.

**War on Cash:** It’s an open secret that developed nations want to abolish cash. Their reasons include such things as being more efficient, fighting criminality and terrorism, and of course eliminating tax evasion. Trouble is, without cash the only place you can keep your money is in the bank! And while banks were considered trustworthy and safe in the past, this is no longer the case. As an alternative *digital* cash, Bitcoin’s price will likely rise as a result.

All of the events listed above will cause people to seek a financial safe haven, which has traditionally been gold and silver. However Bitcoin, as “Gold 2”, has many features that gold lacks, including being easily transportable, transferable online, easy to transact with, very secure with a high level of privacy, and of course the aforementioned store of value quality as a result of its strictly limited supply. As a result, Bitcoin’s price would likely increase as a result of such events. And to get some idea as to how much, consider the following.

The total value of gold in the world is approximately \$7.5 trillion, based on [this data](#). That’s a really **big** number, as a trillion is 1,000 billion and a billion is 1,000 million. So to write a trillion as a number requires 12 zeros - or 1,000,000,000,000.

If Bitcoin captured just 20% of the existing gold market, its market cap would be \$1.5 trillion. Using the figure of 16.5 million bitcoins in circulation, the value of each one would be around \$91,000. And if Bitcoin captured 50% of the gold market, then this safe haven use case alone could drive the price up to around \$227,500.

The truth is, there are multiple use-cases for Bitcoin and a gold-like safe haven asset is just **one** of them. For consider the following:

**Global Remittances:** This is a big one and ripe for full-on Bitcoin adoption. The total value of global remittances - people sending money back to their home country - is \$585 billion per year. The top four countries for global remittance volume are China at \$54.9 billion, the Philippines at \$26.7 billion, France at \$23.3 billion, and Mexico at \$23 billion.

**Global Unbanked:** There are 2.5 billion people on this planet who are “unbanked”, without access to traditional financial services. But they virtually all have mobile phones! Technology can enable such people to leapfrog over the “old” banking industry and adopt Bitcoin, giving them immediate access to the whole world.

**Global Gambling:** This is another perfect “fit” for Bitcoin, due to the difficulty those in the gambling businesses have with traditional financial services. The global *legal* market alone is estimated to be \$700 billion a year, while the *illegal* market, including sports betting, is up to a staggering \$3 trillion!

**Global Drugs Market:** One of the obvious consequences of drug prohibition policy in most countries of the world is the massive illegal drugs market, which has an estimated value of \$4 trillion - a huge number. Once again, Bitcoin offers users an alternative and more private way to pay for it all.

**Global Offshore Banking:** A good portion of the world’s private wealth is held in offshore bank accounts, with estimates of as much as \$21 trillion on deposit. If half this money were to move into Bitcoin - due to increased pressure from governments to close down the offshore banking industry - then this amount of money alone, moving into Bitcoin, would result in a price of around \$636,000.

While some of the above global markets may be unsavoury to many people, one cannot ignore the fact they exist and that Bitcoin could become the currency of choice for many of the people involved - pushing demand for Bitcoin even higher.

When you do the numbers on both “safe haven” and the additional use cases above, it’s not hard to imagine the future value of Bitcoin being \$1 million. But apart from that, more and more people are becoming involved in Bitcoin for a variety of valid reasons - including for financial privacy, investment and the potential of a truly global non-government currency.

Whatever the reason, ordinary folk are moving into Bitcoin at an ever-increasing rate. And at some point in the future this gradual migration to “better money” could turn into a stampede towards mass adoption! When that happens, all current future price estimates for Bitcoin could fall short.

If you add up all the quoted values of the different global markets listed here, you will soon realise Bitcoin can indeed become a major financial force, with a price far in excess of what we see today. So even though many people think they have “missed the boat” and that Bitcoin is already too expensive, the truth is they haven’t, and it isn’t! And here’s another compelling reason why...

## The Elephant in The Room

Ever since Bitcoin was unleashed on the world back in January 2009, when *Satoshi Nakamoto* mined the first “genesis” block, it has primarily been the domain of computer geeks, libertarians and assorted visionaries. In the past couple of years a new type of person has been attracted to the space - the speculator and investor, drawn by the extraordinary profit potential of this “new money” and asset class.

However, all such early adopters have mostly been individuals - people making the decision to invest and risk their own money in Bitcoin. But that is changing. In fact, we are about to witness an historic occurrence - the arrival of **BIG** money, the institutional investors.

The reason they haven’t joined the party so far is because they haven’t been able to - due to the lack of the suitable structures. Institutional investors require a properly regulated market in order to invest their client’s funds. This includes being able to invest through licensed and regulated exchanges and having access to regulated custodial accounts. Up until recently these things were missing from the Bitcoin ecosystem. Not any more.

You may be thinking, “*Why would institutional investors want to risk funds in Bitcoin when it’s so volatile?*” The answer is simple. Firstly, more and more people want exposure to Bitcoin and its potential upside, and investment funds are responding to their clients’ requests. Secondly, institutional investors are always interested in any non-correlated asset - which Bitcoin is. While global news, wars, market updates and changes in political leadership can spook traditional markets, Bitcoin has proven to be unaffected by such happenings - making it an ideal hedge against such, something all institutional investors are interested in.

2018 is the year institutional money arrives. Big money means exactly that - literally trillions of dollars sloshing around the world, looking for somewhere to park and profit. This new money coming into Bitcoin, with its strictly limited supply, can only do one thing - push the price higher. Many analysts are saying Bitcoin could rise up to 10x in 2018 alone - but this is only the start. It’s also an historically unique opportunity to benefit from such an event.

## The Million Dollar Question

So the question you should be seriously asking yourself is, “How can I get a piece of this action and give myself a fighting chance of becoming a millionaire?”

The answer is simple. Make it your goal to own one Bitcoin - just **one**. Then hold on to it for the next few years. Simply forget about it and get on with your life. If Bitcoin reaches its potential, as outlined here, then a \$1 million price point is certainly possible. And if that's the case, you will become a millionaire just buy holding on to that one Bitcoin!

But what if it doesn't reach \$1 million? Of course that is a possibility as no one can predict the future. But if you study Bitcoin's [price history](#) since its inception, you will note it has constantly risen over the longer term. Would you complain if it only reached \$500,000, or even less like \$250,000?

So that's my considered advice, to buy and hold **one** Bitcoin to stake your claim in the cryptocurrency revolution. Yes there is risk, but the upside potential is massive.

There's even better news. You don't even have to buy a whole Bitcoin.

If the the current cost of one Bitcoin is too much for you, you can buy a fraction of one, as it's divisible down to 8 decimal points. In other words, if you've only got \$1,000 to spare you can buy \$1,000 worth of Bitcoin. If you can only afford \$100 worth you can buy that too. And if Bitcoin rises 100x in the next 3 to 5 years, you will make 100x whatever dollar value you put into Bitcoin now.

To your financial freedom!

P.S. If you're still skeptical about Bitcoin's potential to reach **\$1 million** in the future, the following predictions and comments from respected experts in the Bitcoin space may give you more reasons and confidence to seriously consider the “Buy One Bitcoin” future millionaire strategy outlined in this report.
